

Confined Space Entry Management & Support

Focused on Confined Spaces

Our approach to confined space management is simple and is driven by the desire to prevent accidents from occurring. Our experienced on-site managers, supervisors and rescue teams set the benchmark for confined space safety.

On-site Confined Space Management

On-site Confined Space Management This involves knowing where the confined spaces exist, understanding and categorising their risk and managing the work within those spaces. Essentially, creating a safe system of work for confined spaces and overseeing the implementation of those plans.

We provide a professional site management service which interfaces with your own permit to work system. This in turn allows you effective control and coordination of all aspects of work in confined spaces. Our team will ensure that the workforce is properly trained, that safe systems of work are being correctly applied and adhered to and all employees have the correct PPE.

This service does not remove your legal responsibility, but gives you an independent expert focused on the safety aspects of working in confined spaces which allows you to manage your site operations more effectively.

Experienced Confined Space Managers

The expertise and a no compromise attitude to confined space safety that you get from us guarantees peace of mind. So when your business requires additional support, we will work with you to uphold and maintain safety for all those involved.

Fully Managed Service

Our approach to confined space management is simple and is driven by the desire to prevent accidents from occurring. We will identify specific issues with each confined space on your site such as access, egress, atmosphere monitoring, working at heights and create a safe system of work to suit the site and the task.

Additional benefits provided by Johnson Controls include atmosphere monitoring, rescue services, first aid support and training.

Confined Space Supervisors and Safety Observers

Even where you have on-site managers and rescue teams, you may identify a need for additional support and assistance.

As confined spaces can be created even by erecting a protective covering over a work area, the need for a confined space supervisor or observer may only be for a limited period. Nevertheless, your business has a duty to provide an onsite supervisor and safety observer while work is undertaken.

In our experience, it is these roles that are often under estimated and in many cases inappropriate personnel are used which can result in confusion or worse an incident.

To uphold a safe working practice it is imperative that expertise and experience are critical components.

All our site supervisors and safety observers are experienced and fully trained and will work in line with your teams.

Atmosphere Monitoring

Confined space regulations require testing and monitoring of the atmosphere in a confined space, prior to entry and whilst work is being undertaken.

However, your teams and contractors may not have either the equipment or training necessary to safely monitor atmospheres or more importantly be able to interpret the results of such testing.

We are able to offer a complete range of services to meet these requirements which includes pre-project atmosphere surveys, pre-entry tests and ongoing monitoring of atmospheres while the teams are working in confined spaces.
